

Common Rail Removal and Refit Tools

Diesel Point will ensure that your business can easily get involved in the service of diesel engines. Specific Delphi tools will make this a simple task.

The Diesel Point diagnostic package is the first step in ensuring your business can quickly identify any fuel injection problems on any modern diesel vehicle. However, with the faulty component identified you now need to complete the service on the vehicle to develop valuable revenue for your business.

» Specialised Tool Kits

The Diesel Point tool kits will allow you to remove the faulty unit on Delphi Common Rail systems and refit a new or repaired component as quickly as possible. This ensures the minimum wait for your customer and, of course, faster vehicle turn around for your business.

Delphi has developed a range of specific tool kits for Delphi Common Rail systems to ensure that removal and refit of these main system components is an easy and rapid process.

Each tool kit is specifically designed by Delphi Diesel for OE application. The kits are competitively priced to ensure return on investment is as rapid as your new removal and refit process.

Your Technical Partner will be able to advise your exact requirements and supply the tool kits you need to support your diesel business.
